

Cleaning Chemical Dilution / Dispensing Verification Record

Use where the site, chemical supplier or cleaning program requires checks that cleaning chemicals are mixed or dispensed at the current manufacturer-specified use rate. This is not a universal requirement for every food business.

Business / site	Area / line	Record period	Verifier / responsible person

1. Dilution / dispensing checks

Date / time	Product	Task / area	Current manufacturer use rate	Dispensing / mixing method	Check method / measured result	Pass / action ref	Verifier

2. Deviation / adjustment follow-up

Issue / out-of-range result identified	Immediate action / product isolated / solution remade
Dispenser adjustment / maintenance / supplier support	Re-check result / approved by / date

Current manufacturer directions control

Use the current label, PDS or other manufacturer technical directions for the product and task. Record only the check method and acceptance criteria required by the site or chemical supplier. Never mix cleaning products unless the manufacturer specifically directs it.
